

13.3

(a)

$$Q = \sum_{j=0}^L \underbrace{(1 + U_j)}_{\text{bias}} U_{j+1}$$

(b)

From (a)

$$Q = N U_1 + \left( U_1 + \sum_{j=1}^L (1 + U_j) U_{j+1} \right)$$

The parentheses is constant with respect to  $U$ .

$Q$  is independent of data points  $P$  which is not similar to kernel methods.
